CHAPTER 1

The glasses

A daemon you **SEND** out of your game lives on the companion: the app on your phone, the site at home, and any device you give it. This book is about one of those devices, **the glasses**: LilyGO's **T-Glass**, a small screen held before one eye. They carry your daemon where you can see it without looking down. They show the time and the next step, a note you want in view, your daemon and how it is, and in the morning the dream it had.

The glasses show **one thing at a time**, and you choose it from the app. They have one button, no speaker and no menus: the phone is their remote, and the glasses are its window.

a drawing: where each part sits differs from frame to frame

The glasses, from the side the button is on. Only a small square of the screen shows through the prism; the rest of the lens stays clear.

PING No. 021

DEMAND DAEMON CONTENT VECTOR

CONTENT Asks one question and requires an answer. The question is: are you there. It asks again. It has always asked.

CONTEXT Anything that answers is counted as alive. Anything that does not is removed from the list.

The rest of the companion -- the app, its tabs, the hub at home -- is in **THE COMPANION**. How to play the game is in **THE PLAYER'S MANUAL**. Both stand on the LIBRARY's MANUALS shelf, beside this one.

What you need

- **The glasses**, with the companion's own software on them. Glasses from the shop run LilyGO's; the companion's is put on them once, by their cable (Putting the software on).
- **The companion's app on your phone.** The glasses hear it over Bluetooth, and through it reach the hub at home.
- **A daemon to carry.** In the game, choose **SEND** in a daemon's menu and save; then **SYNC** in the app.

CHAPTER 2

First steps

Charging

The glasses charge by their USB-C cable. The battery's charge shows in the corner of **HOME**, and on the glasses' row in the app's **PLACES**.

Starting them

Switch them on at the side. The first time they have no clock and no daemon yet, so the time reads --:--. Everything the glasses know -- the time, your daemon, what to show -- comes from the companion, so linking them is next.

Fitting the picture

The glasses throw their picture onto a prism, and different glasses throw it differently: it may come out turned, mirrored, or too high. It is set **once**, by eye, with the glasses on and their cable in the computer that runs the companion. Four settings, each kept on the glasses:

setting	what it does
TURN	turns the picture a quarter at a time, until it stands upright
MIRROR	flips it, if words read backwards
ROW	moves the square along the screen, until it sits in the middle of what you see
BRIGHT	how bright it is, from dim to full

The companion's wiki, *The T-Glass*, has the words to type for each.

Pairing your phone

Hold the button for three seconds. The glasses buzz and show six numbers. In the app, pair the device; when iOS asks, type the numbers. *Paired.* -- the glasses now talk to your phone whenever it is near, at home or away. A tap gives up; after two minutes they give up by themselves.

The glasses can also be linked **by their cable**, at the computer that runs the hub, with the companion's link script. They learn where the hub is, its key and the time, as any device does.

> **Bluetooth, not Wi-Fi.** The glasses can join your Wi-Fi as any device can, but Wi-Fi is hungry and their battery is small: an hour or two of it would empty them. Through your phone, and dark between glances, they last much longer.

Giving them a daemon

SEND a daemon in the game and SYNC in the app, then choose it for the glasses in **PLACES**, as for any device. It appears on **HOME**, and on **DAEMON**.

CHAPTER 3

What they show

HOME
the time, the daemon, the step

A NOTE
its title, five lines a page

DAEMON
its name, how it is

DARK
nothing: the lens clear

The four screens, as the square looks through the prism. Black is the lens: everything else is light on it.

HOME

The time, large; the battery in the corner; your daemon standing at the foot; and beside it **today's next step**, the one thing the companion has for you now. In the morning, if your daemon has dreamt, the step gives way to *A dream is waiting. Tap.*

A NOTE

One of your notes. Its **first line is its title**, across the top; under it, the rest, five lines a page. A tap turns the page, and after the last it starts again. The page number sits in the corner.

DAEMON

Your daemon, large, with its name and **how it is in a word** -- the same word the app shows on its card. It looks as it has been cared for: well rested, hungry, glad, sleepy.

DARK

Nothing. The screen turns down and the lens is clear, until you want it again. Two taps take you there; one tap brings you back HOME.

Over whatever is showing

Two things lie over the screen for a while, then leave it as it was:

- **A care's reaction.** Tend your daemon from the app, and the glasses show it with what it says, for eight seconds. A note you were reading stays where it was.
- **The morning's dream.** When your daemon has dreamt, the glasses wake with it: *WHILE YOU SLEPT*, then the dream, five lines a page. A tap turns the page; past the last, *good morning* puts it away.

Something new sent buzzes the glasses once, so you know to look.

CHAPTER 4

The button

The glasses have one button, on the side, worked by touch, and a second, **BOOT**, which does what a tap does.

a tap	turns a note's or a dream's page; on DARK, goes HOME; on HOME with a dream waiting, opens it
two taps	DARK
a hold	HOME: it buzzes when it goes
held on, three seconds	shows the numbers that pair your phone

Asleep, the glasses' first tap only wakes them. Left alone they sleep, as every device does; how soon is set in the app, on the glasses' own settings.

CHAPTER 5

GLASSES, in the app

In the app's **PLACES**, once the companion has heard from the glasses, a card called **GLASSES** chooses what they show.

What the glasses should show

At the top, a picture of the glasses' square, drawn from what the glasses are told. It is what they *should* be showing: if the glasses are out of reach, they will show it when they are back.

SHOW

HOME, **DAEMON** or **DARK**: tap one, and the glasses change.

CARE

Drink, **Feed** and **Train**, as on your daemon's own card: your daemon is tended, says what it thinks of it here, and the glasses show its reaction for a few seconds before going back to what they showed.

NOTES

NEW NOTE opens a page whose **first line, tinted, is the title**. Type the title, press Return, and write the rest. **Save** keeps it.

Tap a note to send it to the glasses. Its row is marked *ON THE GLASSES* and stays selected for as long as the glasses show it -- leave the app, come back tomorrow, it is still selected. Send anything else, from the app or with the glasses' own button, and it is not.

Edit changes a note; to rename it, change its first line. If the glasses are showing it, they take the new words at once. **Remove** asks for a second tap.

> **Notes for the glasses are short by nature**: a list, a few lines for a talk, a code you keep forgetting. The glasses take the first nine hundred letters of a note; the app keeps the whole.

CHAPTER 6

Looking after the glasses

The battery

The glasses' battery is small, and LilyGO does not say how small, so this book makes no promise of hours. To make it last:

- **Stay on Bluetooth**, through your phone. Wi-Fi spends it quickly.
- **Go DARK** between glances: two taps.
- A shorter time before they sleep, in the app's settings for the glasses.

Putting the software on

The glasses' software is put on, and brought up to date, by their cable, from the computer that runs the companion: the companion's **update script**, told which device it is. The companion's wiki, *Flashing and linking*, has every step. If the computer cannot reach them, hold **BOOT** while plugging the cable in.

When something is wrong

it says, or does	try
The picture is turned, mirrored, or cut off	fit it by eye (Fitting the picture)
The time reads --:--	the glasses have not heard from the companion yet: pair your phone, or link them by their cable
Tapping a note in the app changes nothing	the glasses hear the app through your phone: is it paired, near, and the app opened lately?
No daemon here yet	SEND a daemon in the game, SYNC in the app, and choose it for the glasses in PLACES
The button does nothing, or presses itself	the button is a touch; the companion's wiki, *The T-Glass*, has how to read what it feels
The screen stays dark	two taps went DARK: tap once. Or they are asleep: tap to wake them

Still to come

- **A nod** as a second button, and a tilt to turn a page -- the glasses feel their own movement, and will.
- **Cue cards**: a note as a prompter, a page a tap.
- **A voice note**, said to the glasses' microphone.

LOOKOUT No. 162

NIGHT WATCH DAEMON **CONTENT**

CONTENT Long enough to see over everything. It has not been relieved.

CONTEXT Everything behind it sleeps because it is up. Nobody has asked when it last slept.

This book is printed again as the glasses change. This printing is v11.356.1, 2026-11-12.

> Every word this book quotes from the glasses is a **DRAFT**, as the game's own are, until it is approved. The glasses' software is **new**: built, and still to be tried on the glasses themselves.
