

The Third Review

Read against the whole bible, *The Bag*, *The Chart*, and the built dialogue quoted in it. Six lenses — logic, fun, machine learning, the opera, psychology, and the things nobody asked for — and one rule inherited from the document itself: **a finding is something checkable; a reading is labelled as one.**

The verdict, up front

THESIS Holds LOGIC ½ CONTEXT survives every lens. The chart is still the argument and the argument is still in the ROM.	BIGGEST CRACK Scorn's biography "He never met her" cannot coexist with a directive addressed to her and minutes he sat in. Pick one.	BIGGEST FUN RISK Vocabulary load Fourteen new nouns in the first fifteen minutes, each "costing a beat". Beats compound.
CHEAPEST BIG WIN Abilities Gen 3 gave you 77 passives and every one is still vanilla. SYNCHRONIZE is PERSPECTIVE for free.		

BREAK

 a contradiction in the canon or the ROM

DRIFT

 text the project has since overruled and not swept

FREE

 a win already sitting in vanilla or in your own rules

IDEA

 outside the box, take or leave

1 · Logical consistency

The bible is unusually good at catching itself — fourteen retracted readings is a record most projects would hide. What it is worse at is **the sweep after the ruling**: a decision lands in one section and three others keep arguing the old position. Ranked.

BREAK Scorn never met Crystal — except in the three places he did 4.4 · 4.10 · 4.20 · 7.5 · 4.21

4.4 rests the whole character on it: *"He never met her. That is the detail that holds the whole character together... He did not initiate the procedure... the file reached him complete."* Then: 7.5 files track 07 as *Fit for Work* (Scorn's **Directive**) — a deadline of Sept 3 addressed to her. 4.20 puts *"Ty and Richard"* inside one field each and says the minutes record *"two present could not follow"* — which puts Richard in the room. 4.21 calls the pair *"two men conferring quietly and filing minutes."* 4.3 makes Ty his partner *before* the rebrand, i.e. while she still ran the lab.

"Scheming vs. procedural" you resolved by frame, correctly. **"Met her" is not a frame; it is a fact.** Either he was in the building and issued the directive — and the horror is that a man who sat across from her still only ever filed — or he arrived afterwards and 07's title, 4.20's "two present", and 4.21 all belong to Ty plus *somebody else*. The second is cleaner for 4.4 and costs the opera one attribution. The first is more frightening and costs 4.4 its favourite sentence. Decide before Ty's Quicksilver line is written, because "I knew" means something different in each.

BREAK PREEMPT is an item and a species 1.6 (2026-09-08) · 4.26 (2026-09-04)

ICE HEAL became PREEMPT four days after MANKEY became PREEMPT. 4.26's collision check validated names against species, moves and types — **not items**. The battle log will read *PIP used PREEMPT on PREEMPT*, which is the exact failure 4.26 exists to prevent. The item is the newer one and the weaker fit (see §7 — a hung process is not fixed by preemption anyway). Add items to the checker while you are there; it will find STUB next time someone names a placeholder item.

BREAK PAYLOAD and ROOTKIT are off-thesis by your own rule 1.7 (09-09) vs 4.26 (09-04)

1.7 draws a sharp line: *EXPLOIT · PAYLOAD · INJECTION · MALWARE · BACKDOOR · BREACH* are refused because they make the world a thriller. Five days earlier the PARAS line shipped as PAYLOAD → ROOTKIT, and the WEEDLE line ends in INJECTOR. Either the rule is about *people* (Corpus never intrudes; wild things may) — in which case say so in 1.7 — or three species need renaming. The parasite reading is apt enough that I would amend the rule: *intrusion words belong to creatures, never to the institution*. That is actually a sharper line than the one written.

BREAK **The chart page argues fifteen types; the ROM fights with seventeen** 2.2 · 9.3 · 9.15 · The Chart

The Chart presents "all 83 relations under our fifteen names" and runs the one-clause test on them. The GBA build has HARDENED and OPAQUE, SENTINEL is SIGNAL/HARDENED, and 9.15 paints plates for eighteen. So: (a) the published chart is a 15×15 slice of a 17×17 table and does not say so; (b) CONTEXT's perfect 8/8 was scored without OPAQUE, which is *immune* to it; (c) 8.1 still says "full type chart, all 15". Re-run the test at seventeen. It will not hurt the thesis — it improves it (see §3, the LOGIC → OPAQUE → CONTEXT → LOGIC cycle).

BREAK **Brazen's B-section was composed on a retracted transcription** 7.10 · 7.11 · 7.13 · Decision log

7.11 retracts "the procedure never descends" (re-scan: 4 up / 3 down) and calls it the document's best-defended claim. Two paragraphs later, "What it buys, mechanically" still says the motif "*rises and never comes down*." 7.13 then builds Music_Brazen's B-section to "*climb, never descend, never resolve*." The decision log lists the claim **and** its retraction as Settled, four lines apart (5532–5536). The music in the ROM may still be right as music; it is no longer *derived* from anything. Re-source it or own it as a composition choice.

DRIFT **"S.T.A.R.R. cannot share the others' tempo" — two of its three songs are at 128** 7.9 · 7.11 · 4.13 · 7.13

7.9's three-axis outlier was built on *Slumbering* alone. *1001 Fatal Error* and *Awakening* are both 128 — the corpus home pulse. Only the asleep machine is at 110, which is a better finding than the one recorded (*it joins the people's tempo when it wakes*). 7.13 dropped the Quicksilver track to 110 to preserve the old finding; that decision now protects nothing.

DRIFT **Grey-era text survives the "colour is context" ruling** 8.6 (09-06) vs 6 · 7.14c · 4.6 · 8.4 · Decision log 5609

Once 8.6 settled a full-colour world with saturation-as-friendship, these became false: 6's "the only place in the game that has colour"; 7.14c "a colourful splash before forty hours of grey"; 4.6 "the greyscale rule means the transformation cannot be shown"; 8.4's title-screen daemons (superseded by the face-off); decision log "Greyscale is the design... colour appears once." One sweep. And note: 4.6's three-form ARTSAI (purple → white) *can* now be shown — a legendary encounter that desaturates from magenta to white is the best colour moment available and nobody has claimed it.

DRIFT **SLEEP is still SLEEP in two places, and a species is named after the state** 4.5 · 4.25 · 1.6

4.5's sleep cluster says "*SLEEP status — unchanged.*" 4.25 gives SENTINEL Insomnia so "*the watcher cannot be put to SLEEP.*" 1.6 renamed it SUSPENDED. Meanwhile JIGGLYPUFF is SUSPEND, so *SUSPEND was SUSPENDED* will occur and reads as a typo rather than a joke. Either lean into it (the one daemon that puts itself to sleep — Jigglypuff literally does) or rename the species LULL, which 8.1a rejected but which now has a reason.

DRIFT **Scorn "has genuinely no idea he did anything" — and then confesses at Callow** 4.4 · 4.31 · 8.6

The gym line — "*The machine chose what I weighted it to choose. We are both to blame.*" — is excellent and it means he knows exactly what he did to the machine. 4.4's sentence should narrow to *about her*: he knows he weighted S.T.A.R.R. (an improvement, in his mind) and has no idea whose lab he weighted it in. That is more precise and more awful.

DRIFT **Dates: the 1001 log starts before the ARTSAI event it is supposed to follow** 4.10

The order puts ARTSAI's ITER 35 (9 MAR) at step 2 and the 1001 sessions "running on, somebody else putting the question" at step 4 — whose first dated entry is **Mar 4**. You wrote "a date is a constraint, not a decoration"; this one is not constraining. Move the ITER log to February, or accept that the sessions predate the event and were hers until Sept 3 (which "somebody else putting the question" contradicts).

DRIFT **Small ones, batched**

- **Vera is "the youngest of the four"** (4.29) — vanilla Daisy is the rival's *older* sister, and nothing says you changed it.

- **Ty's key.** 4.3 leans on "C# minor is Ty's key signature — E major's relative"; 7.8/7.11 already ruled keys track songs, not people, and Ty's two redemption songs are C major.
- **4.14 vs 8.6:** the opera has S.T.A.R.R. reach Ty and "it lands"; the game has it stop in Doldrum and the *player* carry the message. That is a deliberate adaptation (4.17 says so) — 4.14 should say the game inverts it.
- **Crystal is not unreachable in the game.** 4.17's "she is not reachable, so what she said reaches him through whoever walked between them" imports the opera's confinement. In the ROM she is in Blanche from minute one, handing out starters. Ty's not-visiting has to be a choice on both sides, and the text should carry that choice (it half does — "he has learned what happens to things that get explained").
- **MANA vs MP.** 4.30 says "MANA is PP"; *The Bag* ships MP UP / MP MAX; 9.16 has a show called "What is MP?". Two names for one number, and MANA is the only fantasy-register word in the lexicon. See §7 for a better one.
- **9.15's badge-sharing check ran against 151.** FireRed's national dex holds Sableye (Dark/Ghost) and Aggron (Steel/Rock) — two of your five "never co-occur" pairs draw the same plate twice for a traded daemon. Either accept it as post-game jank or share OPAQUE/HARDENED with something else.
- **9.15's justification for FROZEN sharing SIGNAL** — "a signal is what ends a hung process, which is exactly what PREEMPT does" — contradicts 1.6's own distinction (*an interrupt is a signal; preemption is the scheduler*).
- **2.2 gives VECTOR "latent space"** as a concept word while LATENT is a type. The unsupervised starter is literally VECTOR/LATENT, so it is not wrong, but the one-clause test for VECTOR is fighting its own neighbour's name.

2 · Enjoyment

Your own second review said it and you filed it as binding: *the bible is outrunning the slice*. Since then the slice went from 9% to 34% yours, which is real. The risks below are the ones a playtester will feel before they can name.

BREAK The first fifteen minutes spend fourteen beats of confusion

1.5 accepts that BIND "costs a beat the first time." So does DAEMON, USER, BOX, INDEX, BENCHMARK, UNBOUND, REMOTE, DETACH, HALTED, ROUTINE, MP, CACHE, RUN-as-execute. Each is defensible alone; 1.5 counts *three* lessons in fifteen minutes and there are closer to fourteen. Beats are not free and they are not independent — a player who is still resolving DAEMON does not have the attention for REMOTE. **Set a vocabulary budget for the slice:** count first appearances per screen, and let the TUTOR (9.16, the one voice allowed to explain) front-load the two that matter — DAEMON and BOX — before the grass. The rest can arrive when they are used.

BREAK A game that refuses to celebrate needs somewhere else to put the dopamine

LABL was BOUND. is correct and the binding jingle now descends. But vanilla's loop runs on that fanfare, and forty hours of the system declining to be pleased with you is a real drain, not a texture. The fix is already in your thesis: **the system doesn't celebrate; the bond does.** Let the daemon react — the party sprite bounces, or the saturation ticks up one notch visibly on bind and on level — while the text stays flat. The player is rewarded by the creature, never by the Index. That is 8.6's saturation rule made into a feedback loop, and it costs one animation.

BREAK SENTINEL as a random encounter is a wall, not a scene 4.25

"It does nothing, and you cannot leave" is a superb *once*. As a repeating wild encounter with Attack 5 and inflated defences it is a two-minute slog every time the grass rustles, and MEAN LOOK at level six means every one of them. Make the first one scripted (a fixed SENTINEL by the generator, the horror intact), and give the random ones MEAN LOOK later or not at all. Same note for QUORUM in Doldrum Cave, which is post-game and therefore fine.

DRIFT Craft rule 5 is unpaid for benchmarks 2-8

"If a gym's lesson can be skipped by grinding, it is not a lesson." CAIRN is built. The other seven have a concept and a one-line "mechanical lesson" and no mechanics — "punishes split focus" is a wish, not a design. This is the single place the bible's prose-to-ROM ratio is most dangerous, because the gyms are the spine of the fun. One paragraph per leader: party, the one move or ability that *is* the lesson, and what a grinder runs into. (Doldrum already has its answer in the name: a FLOW leader whose gym has no wild encounters and whose trainers heal you — *no slope*.)

DRIFT **SUS is going to be read as**
Among Us by everyone under thirty

The tile will get a laugh you did not write. SSP, SPD-adjacent codes are taken or ugly; ZZZ is vanilla-legible and honest about being asleep; HLD (held) fits the storage register (4.20a). Pick any of them.

DRIFT **The unsupervised starter cannot attack**

Six VECTOR moves in the whole game and LATENT nearly empty; 8.2 knows. The GBA pool is bigger (Aerial Ace, Shadow Ball) but the starter that "is confusing early and excellent late" must at least be *playable* early. CONSENSUS's precedent applies: one reliable VECTOR move at level 7.

FREE **HOTFIX now visibly costs colour**

Heal Powder lowers friendship in Gen 3. With saturation keyed to friendship, a **HOTFIX greys your daemon a notch**. "Nobody is proud of it" became a mechanic the day 8.6 was settled, and nothing has to be written.

FREE **The Index completion line is already written**

On an empty INDEX Crystal says "...*It is empty. That is a result as well.*" On a complete one, say the same sentence with one word changed: "...*It is full. That is a result as well.*" Forty hours between the two, identical register, and the diploma vanilla hands out becomes a shrug. Cheapest ending in the project.

3 · Machine learning accuracy

The technical vocabulary is better than most published ML games. Daemonisation via orphaned fork, cascading failure, thrashing, keepalive, quorum, livelock, speculative execution, the Bayesian PRIOR on Hidden Power, EVs-as-bias, Goodhart in Strathern's phrasing, Information Foraging with the right citation — all correct. Where it is off, it is off in ways that are cheap to fix and usually make the joke better.

DRIFT Preemption does not end a hung process 1.6

Preempting a hung task just gives the CPU to somebody else; the hung one stays hung. What actually ends HUNG is a **watchdog** — a timer that resets a system that has stopped responding. WATCHDOG is eight characters, works twice (a dog; a watchdog timer), rhymes with ROVER, and clears the PREEMPT collision in the same move. PRIORITY, which you already call the weakest, has a better word too: throttles are lifted by a **burst** allowance — BURST, five characters, a burst of speed and burst credits, which is vocabulary your day job runs on.

FREE FROZEN's most common ML sense is missing from its concept line

2.2 glosses FROZEN as "overfit, brittle, hard-coded." In practice the word means *weights that are not updated* — a frozen backbone, frozen embeddings. Add it and two inherited relations stop being inherited: **FROZEN ×2 GROWTH** becomes literal (frozen weights stop training) and **FROZEN ×2 VECTOR** gets a reading (frozen embeddings cannot move in the space). Two points on the one-clause test for one clause.

FREE Seventeen types close a loop the fifteen could not

OPAQUE (Dark) is immune to CONTEXT and beats it; LOGIC (Fighting) beats OPAQUE. So **LOGIC → OPAQUE → CONTEXT → LOGIC** is a cycle: rules open black boxes, black boxes shrug off framing, framing beats rules. That is mechanistic interpretability, the interpretability gap, and the thesis, in one triangle — and it arrived from Game Freak's chart. HARDENED (Steel) resists EMERGENT and is immune to CORRUPT: *hardening contains emergence and cannot be poisoned*. Both are sitting in the vanilla table and neither is in *The Chart*.

FREE Two relations have real names in the literature

STRATUM ×0 VECTOR — "the physical layer cannot reach what has no location" — is Marr's three levels: the implementation level cannot read the computational one. That is a psychology-and-ML citation for the relation you flagged as the hardest to explain. **VECTOR ×2 LOGIC** is Sutton's Bitter Lesson. **SWARM ×2 CONTEXT** is Asch on one side and ensembling on the other — many weak models beat one confident frame. None go in the game; all belong in the chart page's "why" column.

DRIFT Small accuracy notes

- **MOCK vs STUB.** In Fowler's usage a stub returns canned answers and a mock verifies interactions; "the shape of a thing, hollow" is closer to a stub. Ditto copying moves is nearer a *spy*. Nobody will notice; recorded because you like being right.
- **"Consistency is exactly what bias produces"** is the bias–variance tradeoff stated correctly and it is your best ML sentence. It deserves a mechanic (§7).
- **Penphin's "two hemispheres."** Logic-left / emotion-right is pop-neuroscience the field has abandoned. The game never says *hemisphere*, so craft rule 1 protects you; keep it that way in the Index entry.
- **"The sensation of red is the same for everyone"** (0.4) is contested — cone ratios vary about 40:1 between people with normal vision and colour naming is stable anyway. The accurate version is *better* for you: sensation varies wildly and perception is normalised by context. Sensation is the part that is not shared.

4 · Psychology accuracy

Sound throughout, and in three places sharper than the document knows.

FREE Vera's ladder is the Strange Situation

"It is settled. It has stopped watching the door." is Ainsworth's secure attachment, verbatim in spirit: the securely attached explore and stop monitoring the caregiver. The bottom rung — "It would be anywhere else if it could" — is avoidant. You wrote attachment theory as a grooming minigame without a clinical word, which is craft rule 3 performed on a research literature. Do not touch it.

FREE Halftone is disenfranchised grief

"A town that does not know whether it is allowed to grieve" has a name — Doka's *disenfranchised grief*, loss that the surrounding culture does not sanction. It gives the tower's NPCs a real vocabulary of behaviour (private rituals, defensiveness, the funeral held in a back room) without one line about feeling.

FREE The ERRATA exhibit is correctly described

"It only ever tested what it already held" is Wason's confirmation bias exactly; survivorship and argument from incredulity are named right; "we all saw the same picture at the same moment" is collective memory conformity. The one caution: "attributed to the machine, never to the reader" is the right move but it also lets the player off — one card that is about *the curator* ("This card was written by someone who liked the exhibit") would close the gap between craft rule 3 and complicity.

DRIFT The removal plot is handled with real care — keep the guard on Act 2

4.10's rule (procedural, never medical; process, never pathology) is the ethically correct handling and the game's own discipline enforces it. The one door still open is *Nine Scars*: the objection is about standing, which is right, but a "file she kept about him" that lists nine oversteps by Ty puts the son, not the institution, as the instigator. That is a psychological claim (the removal came from inside the family) and it collides with 4.4's "policy that triggered." Decide who filed, because it changes what the player is meant to feel at Quicksilver.

5 · The rock opera, as adapted

The transcriptions have been through more scrutiny than most published musicology and the harmonic readings are mostly sound: I–vi–IV–V shared by *Poly and Fields* and *Crystal's Reply* is real; the Dm|B♭|C|Am no-dominant reading is right in D minor; Ty 74 → 120 against Crystal's 128 → 128 is a genuine structural pair. Three notes.

- **7.3's physics is off by a semitone at the violet end.** $12 \cdot \log_2(700/400) = 9.68$, so a 400nm cut lands between A and A♯; at 380nm it reaches 10.6, which is A♯/B. Only B is unambiguously "no wavelength." The Halftone-on-the-invented-notes reading survives at half strength; say "one to two semitones" rather than two.
- **Where you start decides whether it resolves** (4.21) is the best musical sentence in the bible and it is *also* the thesis about frames — but it depends on assigning a tonic to a four-chord loop, which is exactly the ambiguity you are celebrating. Label it a reading, not a finding, or it joins the retracted.
- **Placement.** Fifteen tracks are transcribed and four have homes. The opera is "character music, not place music" (7.5), so the unplaced motifs are not a backlog — but *Crystal Clear or Crystal Crazy* (the rumour, 160 BPM, four repeated notes) has an obvious one: it is the Five Witnesses' music. Five people saying the same thing over and over until it drops.

6 · The Bag and The Chart, item by item

ENTRY	VERDICT	NOTE
PREEMPT	BREAK	Collides with MANKEY; and preemption is the wrong cure. → WATCHDOG
PRIORITY	DRIFT	You already call it weakest. → BURST (a burst lifts a throttle; burst credits)
MP UP / MP MAX	DRIFT	"PP is a body word" is not true and MANA (4.30) is the lexicon's one fantasy noun. → CYCLES: the word you liked for money and had nowhere to put. A ROUTINE has a budget of cycles; 0.3's loops get a second home.
SUS tile	DRIFT	Reads as Among Us. → ZZZ or HLD
PKRS	IDEA	Open in the log. Pokérus doubles EV gain and spreads by contact — that is bias spreading. → VIRAL. Content goes viral; a daemon that has gone VIRAL skews faster and infects the party. Works twice, five letters, and it teaches SKEW.
MOON STONE	IDEA	Its three evolutions are SUSPEND → HIBERNATE, ANOMALY → OUTLIER, THREAD → SCHEDULER. All three happen on a <i>timer</i> : hibernate after idle, outliers emerge over a series, schedulers are clock-driven. → TIMEOUT, found at Deadstack.
HOTFIX	FREE	Lowers friendship → visibly greys the daemon. Already mechanical.
HEARSAY	FREE	Best rename in the bag. A citation index that admits it does not check.
LEGACY	DRIFT	0/14 and you know. RUST is right: rust is water beating old metal, and rust resists fire because it has already oxidised — two of ROCK's relations back for one word.
VECTOR	IDEA	ABSTRACT recovers the immunity. So does FLOAT (5): a floating-point value — never exactly grounded (STRATUM ×0), wrecked by noise on the line (SIGNAL ×2), and continuous methods beating discrete rules (×2 LOGIC — the Bitter Lesson). Embeddings <i>are</i> float vectors, so the ML reading survives.

ENTRY	VERDICT	NOTE
The Chart	BREAK	Publish the 17×17. Score the one-clause test at 17. Add the "why" for the two new columns — the black-box cycle writes itself.

7 · Outside the box

Ranked by how much argument they buy per byte. Every one obeys craft rule 1.

IDEA Make "IMPROVE RESPONSE CONSISTENCY" a mechanic

Gen 3 damage rolls 85–100%. **Scorn's daemons always roll 100 and never crit; their secondary effects never proc.** His numbers repeat. A player who has done the HEAT show ("damage wobbles") will notice the fight that does not — and nobody says why. Then the CC-7 pull at Quicksilver is the un-weighting: S.T.A.R.R. gets its variance back, and RECURSION is the loop that only runs on a machine allowed to be inconsistent. The bias–variance tradeoff as a boss fight, one flag in the damage calc.

IDEA The ability pass — the second teaching surface you paid for and have not spent

9.3 named abilities as a reason to port. Since then, one (Insomnia). But vanilla already wrote half your argument in them: **SYNCHRONIZE** (Abra line, Mew) passes your status to whoever inflicted it — *your frame becomes mine* — it is **PERSPECTIVE** as a passive and ARTSAI already has it. **TRACE** (Porygon) copies the opponent's ability — *the substrate takes on whatever runs on it*, which is **SUBSTRATE**'s entire Index entry as a mechanic, already on the right species. **MAGNET PULL** (Magnemite) traps **HARDENED** — **SENTINEL** cannot be left by hardened things either. **LEVITATE** is "no location." **PRESSURE** drains MP — **CYCLES** — faster. Seventy-seven names, one register per type like the moves, and it is the surface a player reads on every switch-in.

IDEA Choice Band is Scorn's crime as a held item

FireRed ships it: +50% Attack, locked into one move. That is a weight raised and the alternatives discarded — CC-7 in miniature, holdable. Name it **CONVICTION**: a belief held to, and a sentence handed down. Give one to a Corpus grunt and nothing else needs saying.

IDEA The Five Witnesses differ by edition

Keep the one accurate spatial detail identical on both carts; let the *wrong* details differ. Two players comparing notes can triangulate in half the time — you literally need someone else's context, over a cable, to see the room. 8.4's structural

argument, applied to the one puzzle whose subject is composite perception. Five IF DEF blocks.

IDEA AI's party desaturates over the game

Corpus daemons are grey at friendship 0; AI is not Corpus. But he was raised on pure content optimisation. Start his party in colour at the lab and step its friendship down at each rival fight, so by the incumbent battle his team is grey and yours is not. The transmission failure, visible, and no sneer — the colour was there and he optimised it away. (Scorn's own team, by contrast, might be *full* colour: the man loves his inventory. That would be the most uncomfortable choice available.)

IDEA CONSENSUS scales with the quorum

You wanted it boring. A quieter version keeps it reliable and makes the name true: power 50 + 20 per SWARM daemon in the party. One SWARM is a weak vote; six is 170. "A swarm needs to keep showing up" stops being a tuning note and becomes what the move *is*. Engine work, but small, and it is the one place a party-composition mechanic argues the chart.

IDEA The Schrödinger reading can be made mechanical, cheaply

You held it pending a mechanic. Here is one: the Index's "bound" sprite takes **the saturation the daemon had at the moment it was recorded, and never updates**. Your CAREMUSAI at max friendship is full colour in the party; the Index still shows the grey thing you caught at level 4. Observing through the instrument fixed the record at the instant of observation — a reproduction that loses the original, per daemon, and the player watches the two drift apart for forty hours. One saved byte per species.

8 · What to do first

ORDER	ITEM	COST
1	Rule on Scorn: met her or did not. Rewrite 4.4 or 7.5/4.20/4.21 to match.	one paragraph, before Ty is written
2	Add items to the name-collision checker; rename ICE HEAL (WATCHDOG).	an hour
3	Publish the 17-type chart; re-run the one-clause test at 17; amend 1.7's rule to creatures-may-intrude.	a morning
4	The colour sweep: 6, 7.14c, 4.6, 8.4, decision log. And the tempo sweep: 7.9, 7.11, 7.13, log.	an hour, mostly deleting
5	Benchmarks 2–8: one paragraph of mechanics each, per craft rule 5.	the real work
6	The bind/level reaction on the daemon, not the text. Then play the slice on hardware, which is still the milestone.	one animation

The document already knows its own failure mode — "a number nobody measured is not a constraint, it is a rumour." Its second failure mode is the mirror: a ruling nobody swept is not a decision, it is a draft. Most of §1 is that.

Read against vision.md (v11.111), items.html, typechart.html, and the shipped dialogue quoted within them. Chart cells were checked against the Gen 3 table by hand; all fifteen columns match, which is how the two missing ones were found.
